Metropolis Hackathon on Monad: Project Ideas

Prepared 8 October 2026. Submissions close 14 October, 09:29 GMT+5:30. Bounty details come from the hackathon pages; verify exact requirements before committing.

How to pick

The prizes stack: one main track ($10k per place) plus any number of sponsor bounties. The best project is one idea that honestly touches 4-6 bounties. With about 6 days left, rank every idea by how much real depth it needs on Monad.

The "All tracks" bounties are the cheapest to stack: Envio ($1k), Alchemy ($1k credits), Kimi ($3k credits), Mera x2 ($2.5k each), Nansen ($5k), Chainlink CRE ($3k) and Aurora ($5k). Privy and Dynamic probably compete with Mera as the account layer, so pick one auth approach.

Track 4: Trust, Identity & AI Infrastructure

1. Passkey-owned AI memory vault (top pick)

- **What it does:** Users keep personal data (notes, docs, chat history) encrypted with keys derived from their Mera passkey (PRF). A RAG agent can read it only through scoped, revocable onchain grants, and every access leaves a receipt on Monad.
- **Why it fits:** It matches the track text directly: AI that is useful without a platform capturing the data.
- **Bounties:** Mera: One Passkey, Many Keys; Best Mera UX; Envio (index grants and receipts); Qwen or Kimi (the agent); Alchemy.
- **Why it suits you:** RAG, Supabase and Next.js are already in your skill set. The new part is a thin grant contract.

2. Onchain SLA insurance for AI APIs

- **What it does:** A Chainlink CRE workflow pings LLM endpoints and measures uptime and latency. When an SLA is breached, a contract pays out automatically.
- **Why it fits:** It builds on AI incident-response experience and is an unusual pitch. It earns the CRE bounty ($3k) and sits well in Track 4, and Envio can power a dashboard.

3. Verifiable claims ("fact-check with a passport")

- **What it does:** An AI fact-checker produces claims with sources and a confidence score, then attests the result onchain. Other apps can query a claim's provenance.
- **Weakness:** Easy to build but may look thin to judges unless the attestation and reputation layer is strong.

Track 2: Consumer Products & Payments

4. Cross-border payments for freelancers (Agora, $10k)

- **What it does:** A mobile-first app (PWA or Expo) with Mera passkey onboarding sends AUSD across borders. An AI assistant turns an invoice into a payment, and Aurora handles any-chain deposits.
- **Bounties:** Agora ($10k), Mera, Aurora ($5k), Envio.
- **Risk:** A very specific spec and likely crowded. Follow the Agora requirements exactly.

Track 1: Onchain Finance & Trading

5. Perpl risk radar

- **What it does:** A real-time dashboard for Perpl positions showing liquidation distance, funding exposure and concentration, with Nansen smart-money signals and plain-English LLM explanations.
- **Bounties:** Perpl Analytics ($3k), Nansen ($5k), Envio, Kimi.
- **Why it suits you:** Dashboards are a strength, and it needs the least new infrastructure.

6. Natural-language strategy to guarded Perpl bot

- **What it does:** You describe a strategy and an agent compiles it into a bot with simulation, spending limits and a kill switch.
- **Bounties:** Perpl API ($5k), MetaMask Agent Wallet plugin ($2.5k), CRE, Qwen.
- **Risk:** Trading demos need convincing data and are easy to make look fake.

7. Tokenized AI-credit market on Kuru

- **What it does:** A spot market for LLM credits and compute on Kuru's order book. It is novel and fits the "new markets" bounty ($5k), but it is the hardest to make viable in 6 days.

Track 3: Social, Attention & Culture

8. Feed-algorithm marketplace

- **What it does:** Curators publish ranking algorithms as onchain strategies, users subscribe to them, and curators earn from engagement. Hunyuan ($2k) can power multimodal content understanding.
- **Risk:** It needs content and users to feel real, which is hard to fake for a demo.

Recommendation

Build **#1 (passkey memory vault)**, with **#5 (risk radar)** as the lower-risk fallback.

With #1 you could stack Track 4 ($10k for first place), both Mera bounties ($5k), Qwen ($5k credits), Envio and Alchemy. That is potentially $20k+ at the top end, and it runs mostly on skills you already have.

Realistic 6-day plan

1. **Today:** Create the project in the dashboard, pick the track and bounties, and fund a testnet wallet from the faucet.
2. **Days 1-2:** Mera passkey login, the PRF key, and a minimal grant and receipt contract deployed on Monad.
3. **Days 3-4:** Encrypted storage, the RAG agent, and the Envio indexer.
4. **Day 5:** UI polish and a 2-minute demo video.
5. **Day 6:** Submit early. Don't wait for the last hour of the deadline.

Open question

Solo or team, and web only or mobile-first? That decides whether idea #4 is realistic.
